

ABSTRACT OF THE DISCLOSURE

A mobile terminal includes a controller for switching
a current screen theme of a GUI screen of an application program
5 to a prospective screen theme, the GUI screen including two
or more GUI tools of a same type, and a storage for storing
a plurality of screen theme definition data sets, wherein
the controller loads one of the plural screen theme definition
data sets stored in the storage, which screen theme defines
10 the prospective screen theme, into a memory region reserved
for the application program, and draws the two or more GUI
tools of a same type included in the GUI screen using the
loaded screen theme definition data set, which is stored in
the memory region for the application program. As a result,
15 the entire GUI screen of an application is displayed on a
common screen theme and a screen theme can be switched rapidly,
using a reduced memory capacity.
